1 Introduction

This project defines the standardization, validation, and reporting workflow for OECD pension data so that the pension dataset can be ingested from structured source files and converted into a governed business reporting output. The attached OECD XLSX contains 2279 rows and17 columns with 51 countries and 14 distinct indicator descriptions, which shows that the project is a multi-country pension analytics and reporting initiative rather than a single-use spreadsheet task. The completed pension PDF is treated as the target end-state output, while this BRD back fills the business requirements, governance, controls, and delivery expectations needed to support that outcome.

2 Problem/Impact/Successful Outcome

The Problem	The Impact	The Successful Outcome
A completed pension reporting output exists, but the full business requirement baseline, rule definitions, traceability, and submission-ready BA documentation are missing	Without formal requirements and controls, stakeholders cannot easily validate how raw OECD source records are transformed into trusted business outputs, which increases delivery risk, rework, and audit gaps.	A governed pension data workflow is documented end-to-end, including file intake, validation, mapping, exception handling, curated dataset creation, stakeholder review, and sign-off.

3 Objectives

ID	Business Objective	Business Owner	Business Importance
O-01	Enable structured ingestion of OECD pension data from XLSX and CSV files	Loan Officer	Critical
O-02	Standardize pension indicators, dimensions, and units for consistent reporting	Credit Team	High
O-03	Real-time status tracking	Branch Manager	High
O-04	Reduce processing time to 3-5 days	Operation head	Critical

4 Purpose Of Document

The Business Requirements Specification details the business requirements elicited from the attached source materials and completed reference output. The document presents the requirements in a structured way that facilitates stakeholder review and sign-off while clearly stating what the pension reporting solution must do at a business level. It is intended to support shared understanding, future functional specification, and implementation planning for the pension data reporting solution.

5 Scope

In Scope	Out Of Scope
OECD pension file intake from XLSX and CSV.	Building a public-facing pension portal unless separately approved.
Validation of mandatory fields such as country, indicator, year, unit, and value	Real-time external API integrations not evidenced in the attached files.
Data cleansing, transformation, mapping, and exception reporting.	Pension policy design changes or actuarial recalculation of OECD values.
Reporting-ready output aligned to the completed pension PDF reference.	Source data refreshes beyond the attached dataset version.

6 Definitions, Acronyms and Abbreviations

Abbreviation/Acronym	Description
OECD	Organisation for Economic Co-operation and Development
BRD	Business Requirements Document
UAT	User Acceptance Testing
KPI	Key Performance Indicator
FR	Functional Requirement
NFR	Non-Functional Requirement
ETL	Extract, Transform, Load
AW	Average Work / Average Worker earnings context used in pension indicators.

7 Assumptions

Ref	Risk	Detailed BRS Reference
A01	The attached XLSX is the primary authoritative structured source for design and reporting.	FR-01
A02	The attached CSV contains supporting cross-check data for the same business domain.	FR-01
A03	The completed pension PDF reflects the intended business output format and content baseline.	FR-10
A04	Dummy stakeholder names and roles are used in this draft and can be replaced with actual project names during final submission.	Governance

8 Risks

Ref	Assumption	Detailed BRS Reference
R01	Source data inconsistencies between XLSX and CSV may lead to mapping or reconciliation issues	FR-02, FR-04
R02	Missing approval history from the completed output may delay business sign-off	Governance
R03	Incorrect interpretation of indicator codes or dimensional fields may affect report accuracy	FR-05, FR-06
R04	Manual remediation of data exceptions may increase delivery timelines if data quality issues are high.	FR-07

9 Issues

Ref	Issue	Detailed BRS Reference
I01	Dummy names and contacts have been used for document completion and should be updated if real stakeholder details become available.	Document Control
I02	Detailed source-to-target transformation logic was not explicitly provided and has to be inferred from source structure and final output.	FR-05
I03	The completed PDF shows the end result but not intermediate validation or reconciliation evidence	FR-07

10 Dependencies

Ref	Dependency	Detailed BRS Reference
D01	Access to OECD source files in approved format is required for each reporting cycle.	FR-01
D02	Business confirmation of required indicators and reporting dimensions is required before sign-off.	FR-05
D03	Stakeholder review and UAT completion are required before final submission.	UAT

Stakeholders

1. Business Sponsor - owns funding, outcome, and sign-off.2.
2. Business Analyst - documents scope, rules, and traceability.3.
3. Data Analyst - profiles, validates, and transforms pension data.4.
4. Reporting / Analytics Users - consume pension outputs for business insight.5.
5. QA / UAT Users - validate that outputs align to business expectations.

11 As Is Process

At the beginning of the project, pension data was available in raw Excel and CSV form and the final target output was available as a PDF, but the end-to-end business process was not formally documented in one place. Users had to manually review file structure, understand indicator meaning, verify units and values, and then prepare the reporting output based on interpretation.

As Is Flow: Receive source files -> Review manually -> Validate key columns -> Interpret pension indicators -> Prepare report output -> Send for review

12 Context Diagram

The context view places the OECD pension source at the start, the business and IT teams in the middle, and the client-ready output with stakeholder approvals at the end. This makes the solution boundary clear for client review and governance discussion.

Context View: Kaggle / OECD Source -> Excel and CSV Inputs -> Business Analyst and Data Review -> Validation and Mapping -> Client Output PDF / Portfolio -> Sponsor Approval

13 Process Overview Diagram

The high-level project flow starts from source intake and ends with final sign-off after requirements documentation, validation, chart preparation, and portfolio assembly. This view is useful in a client setting because it shows how the work progressed from raw data to governed delivery.

1. Receive and review source files.
2. Validate fields, values, and units.
3. Identify reporting indicators and business rules.
4. Prepare BRD and governance documentation.
5. Build analytical charts for executive insight.
6. Compile portfolio and obtain approvals.

14 High Level To Be Business Requirements

1. A controlled intake process shall exist for OECD pension data files in XLSX and CSV format.
2. The solution shall validate and standardize pension data before reporting use.
3. Stakeholders shall be able to analyze pension data by country, gender, age group, year, unit, and indicator dimensions.
4. The reporting output shall be reproducible, traceable, and reviewable against the completed pension reference PDF.

15 Detailed Business/IT Requirements

15.1 Functional Requirements

ID	Title	Requirements Description	Type (*)	MoSCoW Priority	Originator	Status (**)	Delivered By	Test ID
FR-01	Source File Upload	System shall allow upload and intake of OECD pension source data in XLSX and CSV formats	Information	Must	BA	Proposed	DATA Team	TC-01
FR-02	Schema Validation	System shall validate the presence of core fields such as country, indicator, year, unit, and value before processing.	Technical	Must	BA	Proposed	Data Team	TC-02
FR-03	Data Profiling	System shall generate record counts, unique country counts, indicator counts, and unit summaries for each load.	Information	Must	BA	Proposed	Data Team	TC-03
FR-04	Data Cleansing	System shall standardize headers, trim text values, normalize dimensional values, and identify duplicates formal formed rows	Information	Must	BA	Proposed	Data Team	TC-04
FR-05	Indicator Mapping	System shall map pension indicator codes and descriptions into business-friendly reporting structures	Business	Must	BA	Proposed	Reporting Team	TC-05
FR-06	Business Rule Checks	System shall validate ranges, numeric types, unit consistency, and	Business	Must	BA	Proposed	DataTeam	TC-06

		dimensional integrity for pension metrics						
FR-07	Exception Logging	System shall log missing, invalid, duplicate, or inconsistent records for remediation and audit review	Information	Must	BA	Proposed	Data Team	TC-07
FR-08	Curated Dataset Output	System shall produce a clean reporting-ready pension dataset for downstream analysis and documentation	Application	Must	BA	Proposed	Reporting Team	TC-08
FR-09	Dimension Filtering	Users shall be able to analyse pension data by country, gender, age group, unit and year	Application	Should	BA	Proposed	Reporting Team	TC-09
FR-10	Output Generation	System shall generate outputs aligned with the structure and business expectation of the completed pension PDF	Application	Should	BA	Proposed	Reporting Team	TC-10
FR-11	Export Capability	Users shall be able to export curated data and supporting logs in standard office formats.	Technical	Could	BA	Proposed	IT Team	TC-11

- Accepted

MoSCoW Rating:-

- **Must Have**: Describes a requirement that must be satisfied in the final solution for the solution to be considered a success.
- **Should Have**: Represents a high-priority item that should be included in the solution if it is possible. This is often a critical requirement but one which can be satisfied in other ways if strictly necessary.
- **Could Have**: Describes a requirement which is considered desirable but not necessary. This will be included if time and resources permit.
- **Would Have**: Represents a requirement that stakeholders have agreed will not be implemented in a given release, but may be considered.

15.2 Process Diagram

Detailed process linkage:

FR-01 -> FR-02 -> FR-03 -> FR-04 -> FR-05 -> FR-06 -> FR-07 -> FR-08 -> FR-09 / FR-10 -> FR-11

15.3 Non Functional Requirements

ID	Title	Requirements Description	Type (*)	MoSCoW Priority	Originator	Status (**)	Delivered By	Test ID
NFR-01	Performance	File validation and profiling should complete within2 minutes for the current project dataset size	Performance	Must	BA	Proposed	IT/DataTeam	NTC-01
NFR-02	Availability	Artifacts and outputs shall be available to business stakeholders during review and sign-off windows	Availability	Must	BA	Proposed	IT Team	NTC-02
NFR-03	Security	Access to source data and output files shall be role-controlled and limited to authorized users	Security	Must	BA	Proposed	IT Team	NTC-03
NFR-04	Auditability	Each load shall retain source file name, processing status, and exception history for audit review.	Audit	Must	BA	Proposed	Data Team	NTC-04
NFR-05	Maintainability	Mapping rules and documentation shall support future OECD data refresh cycles without full redesign	Maintainability	Should	BA	Proposed	BA/Data Team	NTC-05
NFR-06	Usability	Business-facing out puts shall use understandable labels and structured documentation rather than raw technical fieldnames	Usability	Should	BA	Proposed	Reporting Team	NTC-06

Non-Functional requirements checklist: -

TYPE	***SAMPLE DETAIL***
SECURITY	
Login Requirements	*Access levels, CRUD levels (Create/Retrieve/Update/Delete)*
Password Requirements	*Length, special characters, expiry, recycling policies*
Inactivity Timeouts	*Durations, actions*
AUDIT	
Audited Elements	*What business elements will be audited*
Audited Fields	*Which data fields will be audited*
Audit File Characteristics	*Before image, after image, user & time stamp*
PEFORMANCE	
Response Times	*Application loading, screen open & refresh times*
Processing Times	*Functions, calculations, imports, exports*
Query & Reporting Times	*Initial loads & subsequent loads*
CAPACITY	
Throughput	*How many transactions per hour does the system need to be able to handle?*
Storage	*How much data does the system need to be able to store?*
Year on year growth requirements	
AVAILABILITY	
Hours of Operation	*When is it available? Consider weekends, holidays, maintenance times etc*
Locations of Operation	*Where should it be available from; what are the connection requirements?*
RELIABILITY	
Meantime Between Failures	*What is the acceptable threshold for down-time eg. one a year, 4,000 hours etc*
Meantime To Recovery	*If broken, how much time is available to get the system back up again?*
INTEGRITY	
Fault Trapping	*How to handle electronic interface failures*
Bad Data Trapping	*Data imports; flag-and-continue or stop the import policies etc*
Data Integrity	*Referential integrity in DB tables and interfaces*
Image Compression & Decompression Standards	
RECOVERY	
Recovery process	*How do recoveries work; what is the process?*
Recovery Timescales	*How long should a recovery take to perform?*
Backup Frequencies	*How often is the transaction data, set-up data and system (code) backed up?*
Backup Generations	*What are the requirements for restoring to previous instance(s)?*
COMPATIBILITY	
Compatibility With Shared Application	*What other systems does it need to talk to?*
Compatibility With 3rd Party Applications	*What other systems does it have to live with amicably?*
Compatibility On Different Operating Systems	*What does it have to be able to run on?*

Compatibility On Different Platforms?	*What are the hardware platforms it needs to work on?*
MAINTAINABILITY	
Conformance to Architecture Standards	*What are the standards it needs to conform to or have exclusions from?*
Conformance to Design Standards	*What design standards must be adhered to or exclusions created?*
Conformance to Coding Standards	*What design standards must be adhered to or exclusions created?*
USABILITY	
Look And Feel Standards	*Screen element density, layout and flow, colours, UI, metaphors, keyboards and shortcuts*
Internationalization/ Localization Requirements	*Languages, spellings, keyboards, paper sizes etc*

16 Business Impact Assessment

Lens	Key Impacts
Process	A documented pension data workflow will reduce ambiguity between raw source intake and final reporting output, replacing ad hoc interpretation with a governed process.
People	Business analysts, data analysts, and reporting users will need alignment on indicator meaning, exception handling, and sign-off responsibilities.
Customer	Internal stakeholders and report consumers will receive more reliable and traceable pension outputs based on consistent rules.
Financial	Primary benefits are reduced rework, improved reporting confidence, and repeatable future refresh cycles rather than direct revenue generation.
Data & MI	The dataset spans countries, indicators, units, and multiple pension metrics, so governance and mapping are essential for accurate MI and reporting
Supplier	No third-party supplier dependency is explicitly evidenced in the attached pension project files
Management	Management will require review checkpoints, issue visibility, and sign-off control over the final reporting package.
Governance & Risk	Governance improves through documented rules, traceability, UAT, issue logging, and approval structure.

17 Costs

Items	Amount (₹)	Frequencies	Notes
Business analysis and documentation effort	To Be Confirmed	One time	Depends on review cycles and stakeholder availability
Data validation and reporting preparation effort	To Be Confirmed	Per Delivery Cycle	Depends on data quality exceptions
Tooling / storage / collaboration cost	To Be Confirmed	Recurring if implemented	No explicit cost data was provided in attached files
Total	**NA**	***Expected ROI:*** *To be Confirmed.*	
Annual Recurring	**NA**		

18 Appendices

Appendix A:
The OECD pension dataset includes structured dimensions such as country, indicator description, year, unit, and value. Example business measures found in the source include Current retirement ages for a person who entered the labour force at age 22, Future retirement ages for a person who entered the labour force at age 22, Gross pension replacement rate, Net pension replacement rate, Gross pension wealth, Net pension wealth, Life expectancy at birth, Average worker earnings.

Appendix B:
This BRD has been drafted in the style of the attached Loan Processing System BRD while adapting the content to the pension data files and pension project reference output.
